

# To Spray or Nay?

## Pre-Harvest Options for Straight-Combined Canola

Chris Holzapfel, MSc, PAg

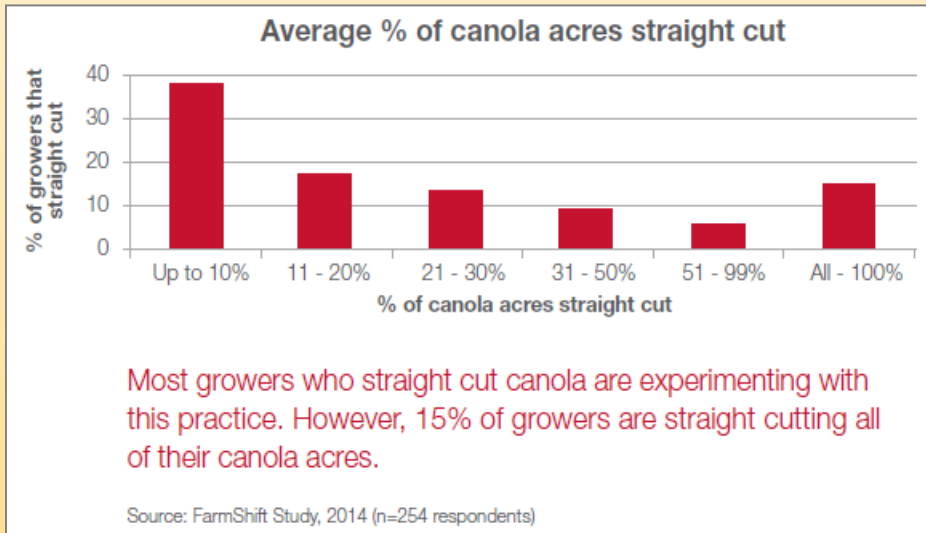

# How much canola is straight-cut?

## 2009 Canola Council of Canada Survey

- 14.6% of growers straight-combine at least some canola
- 13.8% would like to start this practice or increase straight-combined acres

## 2014 FarmShift Survey (BASF)

## 2018 Stratus Market Research (BASF)

- Estimated nearly 40% of Canadian canola acres straight cut at harvest
- Prediction of 50% for 2020? ([https://agro.basf.ca/basf\\_solutions/seedsandsystems/invigor\\_pod\\_shatter\\_west.html](https://agro.basf.ca/basf_solutions/seedsandsystems/invigor_pod_shatter_west.html))

# Reasons for straight-combining from canola growers who were doing so in 2014 (Farmshift-BASF)

## Percent of respondents

# How do yields between swathed & straight-cut canola compare in plots? (PRIOR TO MODERN POD-SHATTER RESISTANCE)

# Early Swathing = Smaller Seeds = Lower Yields (Indian Head 2013 – variety 5440)

- Postponing swathing from Aug 21 (<30% SCC) to Aug 27 (~50% SCC) increased yield by 8%, largely attributed to 10% increase in seed size
- Swathing canola at a more optimal growth stage (60-70% SCC) should not impact either seed size or yield

# LL Canola Pre-Harvest Options Demo

## (ADOPT – Indian Head 2016)

### Treatments:

1. **Untreated**
  2. **0.67 l/ac Roundup Transorb HC**  
~60-65% SCC, applied Aug. 29 (242)
  3. **59 ml/ac Heat LQ + 0.2 l/ac Merge**  
~ 70-75% SCC, applied Sep. 2 (246)
  4. **0.67 l/ac Roundup + 59 ml/ac Heat LQ + 0.2 l/ac Merge**  
~ 70-75% SCC, applied Sep. 2 (246)
  5. **0.70 l/ac Reglone + 0.1% Agrol 90**  
~ 90-95% SCC, applied Sep. 8 (254)
- All treatments applied in 20 U.S. gal/ac solution volume
  - Variety – L140P; Location – Indian Head, SK

# Effects on Canola Seed Yield (IH-16)

# Evaluation of Pre-Harvest Options for Straight-Combined Canola

**Locations:** Indian Head, Melita, Melfort, & Scott (2017-2019)

## Treatment Descriptions

1) LL – untreated	6) RR – untreated
2) LL – glyphosate (890 g ai/ha) <sup>Z</sup>	7) RR – gluf. ammonium (408 g ai/ha) <sup>YX</sup>
3) LL – saflufenacil (50 g ai/ha) <sup>Z</sup>	8) RR – saflufenacil (50 g ai/ha) <sup>Z</sup>
4) LL – glyphosate (890 g ai/ha) + saflufenacil (50 g ai/ha) <sup>Z</sup>	9) RR - glyphosate (890 g ai/ha) + saflufenacil (50 g ai/ha) <sup>Z</sup>
5) LL – diquat (40 g ai/ha) <sup>Y</sup>	10) RR – diquat (40 g ai/ha) <sup>Y</sup>

LL – glufosinate ammonium tolerant; RR – glyphosate tolerant

<sup>Z</sup> applied at 60-75% seed colour change; <sup>Y</sup> applied at 90% seed colour change

<sup>X</sup> not a registered option for pre-harvest applications on canola

**Data Collected:** Visual stem dry-down ratings, whole plant and seed moisture at harvest, seed size, percent green seed, yield

**NOTE:** Data for this project is still being summarized, certain results in this presentation are still considered preliminary

	Glyphosate		
Pros	<ul style="list-style-type: none"><li>• Excellent weed control</li><li>• Potential for crop dry-down benefits with non-glyphosate tolerant canola</li><li>• Unlikely to cause grading issues</li><li>• Lower water volumes okay</li><li>• Relatively low cost</li></ul>		
Cons	<ul style="list-style-type: none"><li>• Slow activity, must be applied relatively early to realize potential crop dry-down benefits</li><li>• Potential for inconsistent crop dry-down &amp; no such dry-down benefit w/glyphosate tolerant canola</li></ul>		

	Glyphosate	Glyphosate + Saflufenacil	
Pros	<ul style="list-style-type: none"> <li>• Excellent weed control</li> <li>• Potential for crop dry-down benefits with non-glyphosate tolerant canola</li> <li>• Unlikely to cause grading issues</li> <li>• Lower water volumes okay</li> <li>• Relatively low cost</li> </ul>	<ul style="list-style-type: none"> <li>• Excellent weed control</li> <li>• Potential for crop dry-down benefits for all canola varieties</li> <li>• More rapid dry-down of certain broadleaf weeds compared to glyphosate alone</li> <li>• Unlikely to cause grading issues</li> </ul>	
Cons	<ul style="list-style-type: none"> <li>• Slow activity, must be applied relatively early to realize potential crop dry-down benefits</li> <li>• Potential for inconsistent crop dry-down &amp; no such dry-down benefit w/glyphosate tolerant canola</li> </ul>	<ul style="list-style-type: none"> <li>• Somewhat inconsistent crop dry-down benefits, particularly with RR canola</li> <li>• Higher water volumes required for coverage</li> <li>• Relatively high cost</li> </ul>	

	Glyphosate	Glyphosate + Saflufenacil	Diquat
Pros	<ul style="list-style-type: none"> <li>• Excellent weed control</li> <li>• Potential for crop dry-down benefits with non-glyphosate tolerant canola</li> <li>• Unlikely to cause grading issues</li> <li>• Lower water volumes okay</li> <li>• Relatively low cost</li> </ul>	<ul style="list-style-type: none"> <li>• Excellent weed control</li> <li>• Potential for crop dry-down benefits for all canola varieties</li> <li>• More rapid dry-down of certain broadleaf weeds compared to glyphosate alone</li> <li>• Unlikely to cause grading issues</li> </ul>	<ul style="list-style-type: none"> <li>• Most rapid, consistent, &amp; complete crop dry-down, effective for all canola varieties</li> <li>• Later application stage can provide added flexibility in deciding whether or not spray is likely to be beneficial</li> </ul>
Cons	<ul style="list-style-type: none"> <li>• Slow activity, must be applied relatively early to realize potential crop dry-down benefits</li> <li>• Potential for inconsistent crop dry-down &amp; no such dry-down benefit w/glyphosate tolerant canola</li> </ul>	<ul style="list-style-type: none"> <li>• Somewhat inconsistent crop dry-down benefits, particularly with RR canola</li> <li>• Higher water volumes required for coverage</li> <li>• Relatively high cost</li> </ul>	<ul style="list-style-type: none"> <li>• Minimal weed control benefit</li> <li>• Potential quality issues (green seed) if applied too early</li> <li>• Higher water volumes required</li> <li>• Performance can vary with conditions during &amp; following application</li> </ul>

# Are Pre-Harvest Applications for Straight-Combined Canola Necessary?

- The risks associated with not spraying are arguably much lower now that we have reliable genetic pod shatter tolerance
- Properly selected & applied products should not adversely affect yield or quality but can:
  - Address variation in maturity
  - Enable earlier harvest (in most but not all cases) & make harvest operations easier to time & plan for
  - Allow for an easier, faster harvest (potentially lower fuel use) by accelerating dry-down of MOG
  - Dry down green weeds, provide opportunity for perennial weed control
  - Potentially improve storability, especially in the absence of aeration (less high moisture dockage)

# When are pre-harvest applications most likely to be beneficial?

- Wet, cool weather going into GS 80-89 (ripening) can lead to delayed maturity & stems staying green for prolonged periods
- Low plant populations (i.e. <math><4-5\text{ ft}^2</math>), delayed or variable fields take longer to dry down & make timing operations difficult
- Delayed seeding (conditions are generally less favorable for natural dry-down later in the fall)
- Green weeds (especially perennials)
- Varieties susceptible to pod drop/shatter due to higher risk associated w/harvest delays
- Large farm size
  - Straight-combining is slower than picking up swaths, pre-harvest applications don't guarantee earlier harvest but can make the overall logistics of planning harvest easier to manage & may facilitate higher travel speeds during combining
